

# Exercise 3 12310401 王子恒.

3.1 P 2 9 6 5 25 8  
12 10 4 2

P 2 r P 2 r  
12 10 4 2 9 6 5 25 8

P 2 r P.S r P.S r  
12 10 4 2 9 6 5 25 8

P.S r P.S r P.S r P.S r  
12 10 4 2 9 6 5 25 8

P.S r P.S r P.S r P.S r  
12 10 4 2 9 6 5 25 8

P.S r P.S r P.S r P.S r  
4 10 12 2 9 5 6 8 25

P 2 r P 2 r  
2 4 9 10 12 5 6 8 25

P 2 r  
2 4 5 6 8 9 10 12 25

3.2 Base: when  $n=1$

$$T(1) = d + c \cdot \log 1 = d. \text{ the base is true}$$

Assume for  $k \geq 1$ ,  $n = 2^k$ , we have

$$T(2^k) = d \cdot 2^k + c \cdot 2^k \log 2^k$$

we should show that the statement still holds for

$$T(2^{k+1}) = d \cdot 2^{k+1} + c \cdot 2^{k+1} \log 2^{k+1}$$

$$\begin{aligned} \text{proof: } T(2^{k+1}) &= 2(d \cdot 2^k + c \cdot 2^k \log 2^k) + c \cdot 2^{k+1} \\ &= d \cdot 2^{k+1} + c \cdot 2^{k+1} \log 2^k + c \cdot 2^{k+1} \\ &= d \cdot 2^{k+1} + c \cdot 2^{k+1} (\log 2^k + \log 2) \\ &= d \cdot 2^{k+1} + c \cdot 2^{k+1} \log 2^{k+1} \end{aligned}$$

Thus, we have shown that the solution to the recurrence is  $T(n) = dn + cn \log n$  for all  $n = 2^k$ , ( $k \geq 0$ ).

$$3.3 \quad n^{\log_4 2} = n^{\frac{1}{2}}$$

$$1. \quad f(n) = 1 = O(n^{\frac{1}{2} - \epsilon}) \quad \text{for any } 0 < \epsilon < \frac{1}{2}$$

$$\therefore T(n) = \Theta(n^{\frac{1}{2}})$$

$$2. \quad f(n) = \sqrt{n} = \Theta(n^{\frac{1}{2}} \log^0 n) \quad \text{for } k=0$$

$$\therefore T(n) = \Theta(n^{\frac{1}{2}} \log^{k+1} n) = \Theta(n^{\frac{1}{2}} \log n)$$

$$3. \quad f(n) = \sqrt{n} \log^2 n = \Theta(n^{\frac{1}{2}} \log^2 n) \quad \text{for } k=2$$

$$\therefore T(n) = \Theta(n^{\frac{1}{2}} \log^{k+1} n) = \Theta(n^{\frac{1}{2}} \log^3 n)$$

$$4. \quad f(n) = n = \Omega(n^{\frac{1}{2} + \epsilon}) \quad \text{for } 0 < \epsilon < \frac{1}{2}$$

$$\text{and } af\left(\frac{n}{b}\right) = 2f\left(\frac{n}{4}\right) = \frac{n}{2} \leq \frac{2}{3}n \quad \text{for } c = \frac{2}{3}$$

$$\therefore T(n) = \Theta(n)$$

3.4 BinarySearch (A, x, low, high):

if low > high:

$\Theta(1)$

return -1

$\Theta(1)$

mid = low + (high - low) / 2

$\Theta(1)$

if A[mid] == x:

$\Theta(1)$

return mid

$\Theta(1)$

else if A[mid] > x:

$\Theta(1)$

return BinarySearch (A, x, low, mid)  $T\left(\frac{n}{2}\right)$

else:

return BinarySearch (A, x, mid+1, high)  $T\left(\frac{n}{2}\right)$

$$T(n) = T\left(\frac{n}{2}\right) + \Theta(1)$$

$$n^{\log_b a} = n^{\log_2 1} = n^0 = 1$$

$$f(n) = \Theta(1) = \Theta(1 \cdot \log^k n) \text{ for } k=0$$

$$\therefore T(n) = \Theta(n^0 \cdot \log^{k+1} n) = \Theta(\log n)$$
