Solutions for Exercise Sheet 3

Handout: Oct 8th — Deadline: Oct 15th - 4pm

Question $3.1 \quad (0.25 \text{ marks})$

Consider the following input for MergeSort:

12	10	4	2	9	6	5	25	8
----	----	---	---	---	---	---	----	---

Illustrate the operation of the algorithm (follow how it was done in the lecture notes).

Solution:

12	10	4	2	9	6	5	25	8

Divide:

Divide:

Divide:

Divide:

Conquer:

10 12

Conquer:

4	10	12]	2	9		5	6]	8	25
---	----	----	---	---	---	--	---	---	---	---	----

Conquer:

2	4	9	10	12		5	6	8	25
---	---	---	----	----	--	---	---	---	----

Conquer:

2	4	5	6	8	9	10	12	25

Question 3.2 (0.5 marks) Prove using the substitution method the runtime of the MERGE-SORT Algorithm on an input of length n, as follows. Let n be an exact power of 2, $n = 2^k$ to avoid using floors and ceilings. Use mathematical induction over k to show that the solution of the recurrence involving positive constants c, d > 0

$$T(n) = \begin{cases} d & \text{if } n = 2^0 = 1\\ 2T(n/2) + cn & \text{if } n = 2^k \text{ and } k \ge 1 \end{cases}$$

is $T(n) = dn + cn \log n$ (we always use log to denote the logarithm of base 2, so $\log = \log_2$).

Hint: you may want to rewrite the above by replacing n with 2^k . Then the task is to prove that $T(2^k) = d2^k + c2^k \cdot k$ using the recurrence

$$T(2^k) = \begin{cases} d & \text{if } k = 0\\ 2T(2^{k-1}) + c2^k & \text{if } k \ge 1 \end{cases}$$

Solution: We use the hint to rewrite the formula in terms of 2^k instead of n.

Base case: we first prove the statement for k = 0. Here the first line in the definition of $T(2^k)$ applies: for k = 0 we have $T(2^0) = d = d2^0 + c2^0 \cdot 0$.

Inductive step: assume that the claim holds for $x \ge 0$, that is, $T(2^x) = d2^x + c2^x \cdot x$. Then we show that it holds for x + 1:

$$T(2^{x+1}) = 2T(2^x) + c2^{x+1}$$
 (using the second line of the recurrence)
= $2 \cdot (d2^x + c2^x \cdot x) + c2^{x+1}$ (using the assumption here)
= $d2^{x+1} + c2^{x+1} \cdot x + c2^{x+1}$ (as $2 \cdot 2^x = 2^{x+1}$)
= $d2^{x+1} + c2^{x+1} \cdot (x+1)$.

Hence the statement also holds for x + 1, completing the induction.

Question 3.3 (0.5 marks) Use the Master Theorem to give asymptotic tight bounds for the following recurrences. Justify your answers.

- 1. T(n) = 2T(n/4) + 1
- 2. $T(n) = 2T(n/4) + \sqrt{n}$
- 3. $T(n) = 2T(n/4) + \sqrt{n}\log^2 n$
- 4. T(n) = 2T(n/4) + n

Solution: Since $\log_b a = \log_4 2 = 1/2$, for all four recurrences the watershed function is $n^{\log_b a} = n^{\log_4 2} = n^{1/2} = \sqrt{n}$.

- 1. $f(n) = 1 = O(n^{1/2 \epsilon})$ for any $0 < \epsilon < 1/2$, so Case 1 of the Master Theorem holds, and $T(n) = \Theta(n^{\log_b a}) = \Theta(\sqrt{n})$.
- 2. $f(n) = n^{1/2} = \Theta(n^{1/2} \log^k n) = \Theta(n^{1/2})$, where the last equality holds for k = 0, and Case 2 holds. Thus, $T(n) = \Theta(n^{\log_b a} \log^{k+1} n) = \Theta(n^{1/2} \log n)$.
- 3. $f(n) = n^{1/2} \log^2 n = \Theta(n^{1/2} \log^k n)$ for k = 2. So Case 2 holds again and $T(n) = \Theta(n^{\log_b a} \log^{k+1} n) = \Theta(n^{1/2} \log^3 n)$.

4. $f(n) = n = \Omega(n^{1/2+\epsilon})$ for any $0 < \epsilon < 1/2$. So Case 3 holds if also the regularity condition holds.

$$af(n/b) \le cf(n) \iff 2 \cdot n/4 \le c \cdot n \iff n/2 \le c \cdot n \iff c \ge 1/2$$

Thus, a constant c < 1 exists, Case 3 holds, and $T(n) = \Theta(f(n)) = \Theta(n)$.

Question 3.4 (0.5 marks) Write the pseudo-code of the recursive BINARYSEARCH(A, x, low, high) algorithm discussed during the lecture to find whether a number x is present in an increasingly sorted array of length n. Write down its recurrence equation and prove that its runtime is $\Theta(\log n)$ using the Master Theorem.

Solution:

10:

return false

```
BINARYSEARCH(A, x, low, high)
1: if low \leq high then
         \overline{\text{mid}} = \lfloor (\frac{\text{low} + \text{high}}{2} \rfloor)
2:
         if A[mid] < x then
3:
               return BINARYSEARCH(A, x, \text{mid} + 1, \text{high})
4:
         else if A[mid] > x then
5:
               return BINARYSEARCH(A, x, low, mid - 1)
6:
         else
7:
8:
               return true
9: else
```

The Master theorem allows us to ignore the floors and ceilings hence we consider the following recurrence: T(n) = T(n/2) + c. The watershed function is $n^{\log_b a} = n^{\log_2 1} = n^0 = 1$. Since $f(n) = c = \Theta(n^{\log_b a} \log^k n) = \Theta(1)$ for k = 0, Case 2 holds and the runtime is $T(n) = \Theta(n^{\log_b a} \log^{k+1} n) = \Theta(\log n)$.

Question 3.5 (0.25 marks) Implement the MergeSort(A, p, r) algorithm and the BinarySearch(A, x, low, high) algorithm designed in the previous question. Solve programming problems "Find x", "Inversion Pair" and "Key Letter K in Keyboard" provided on Judge.
